

Silver Springs Water Inc. bottled water report supporting document

Statement of quality

At Silver Springs Water Inc., we are proud of the quality of our bottled drinking water products. The Silver Springs Water regional brands are:

- Purified Drinking Water
- 9.0 High pH (alkaline water)
- Planet Ion (negative ion alkaline water)

meets or exceeds all applicable bottled water standards for quality and safety at the federal and state level. The US Food and Drug Administration (FDA) regulate bottled water as a food. Silver Springs Water Inc. uses certified laboratories to perform extensive tests on its water sources and bottled water products to routinely monitor compliance with all applicable federal and State bottled water regulations.

For more information about the Silver Springs Water Inc. brands, please visit www.wateroffer.com or call 1-877-453-6223.

Henderson NV 89011

In addition to existing stringent regulatory standards, the International Bottled Water Association (IBWA) maintains a strict Bottled Water Code of Practice for its members. Silver Springs Water Inc. is a member of IBWA and meets or exceeds the quality requirements of the IBWA Code of Practice. Additionally, we take pride in the fact that our bottled water production plants are annually inspected by independent third-party organizations. These annual plant inspections coupled with annual product testing, ensure that the Silver Springs Water Inc. brands comply with federal and State bottled water regulations and the IBWA Code of Practice. For more information about IBWA and the IBWA Code of Practice, please visit their website at <http://www.bottledwater.org> or call IBWA at 1-800-WATER-11.

Processing Steps (Treatment) for Purified Water and Purified Water with Minerals Added for Taste

The source water is filtered to remove impurities and particulate material. The water is taken through additional micron-filtration and reverse osmosis to remove organic and inorganic components from the municipal source water. A mineral injection system adds trace amounts of select food-grade minerals to enhance the taste. Ozone is used as an additional safety, disinfection step.

The following terms and statements, in most instances are not applicable to bottled water and may be in conflict with federal bottled water regulations, but are required by California law (SB 220):

Statement of quality – The standard of quality for bottled water is the highest level of a contaminant that is allowed in a container of bottled water, as established by the Food and Drug Administration and the California Department of Public Health. The standards can be no less protective of public health or less stringent than the standards for public drinking water.

Maximum contaminant level (MCL) - The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs as is economically and technologically feasible.

Public health goal (PHG) - The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Primary drinking water standard - MCLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

For information on FDA recalls:

<http://www.fda.gov/opacom/7alerts.html> . Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the United States Food and Drug Administration, Food and Cosmetic Hotline (1-888-723-3363). Some persons may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons, including, but not limited to, persons with cancer who are undergoing chemotherapy, persons who have undergone organ transplants, persons with HIV/AIDS or other immune system disorders, some elderly persons, and infants can be particularly at risk from infections. These persons should seek advice about drinking water from their health care providers. The United States Environmental Protection and the Centers for Disease Control and Prevention guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791). The sources of bottled water include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water naturally travels over the surface of the land or through the ground, it can pick up naturally occurring substances as well substances that are present due to animal and human activity. Substances that may be present in the source water include any of the following: (1) Inorganic substances, including, but not limited to, salts and metals, that can be naturally occurring or result from farming, urban storm water runoff, industrial or domestic wastewater discharges, or oil and gas production. (2) Pesticides and herbicides that may come from a variety of sources, including, but limited to, agriculture, urban storm water runoff, and residential uses. (3) Organic substances that are byproducts of industrial processes and petroleum production and can also come from gas stations, urban storm water runoff, agricultural application, and septic systems. (4) Microbial organisms that may come from wildlife, agricultural livestock operations, sewage treatment plants, and septic systems. (5) Substances with radioactive properties that can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that bottled water is safe to drink, the United States Food and Drug Administration and the [California] State Department of Public Health prescribe regulations that limit the amount of certain contaminants in water provided by bottled water companies.

Water Quality Data

Attached is a copy of our water quality analyses as conducted by certified labs. The analysis includes bottled drinking water quality test results for substances including inorganics, organics, and radiological as well as physical parameters.
